landmark extraction plus a baseline classifier — so you have something running this week?

what requerements am i need? and can you fully explain about this project

Orchestrated comprehensive project overview referencing visual documentation

Here's the full pipeline so you can see exactly how the pieces connect before I break down what each one needs:

The teal row (top) is your training pipeline — you run it once, offline, to produce a saved model file. The blue row (bottom) is your live demo — it reuses the exact same landmark-extraction code, then loads that saved model to make real-time predictions. That's the whole project in one picture. Now here's everything underneath it.

What you actually need

Hardware: Just a lanton from the last several years with a built-in or USB webcam. No GPU

⚠️ Use caution before running this prompt. Malicious conversation content could trick Claude into attempting harmful actions or sharing your data.

How does MediaPipe hand landmark extraction work?

Sonnet 5 Medium
